- Outline**
- Introduction and Framework
  - Dimension Reduction
  - Fingerprinting

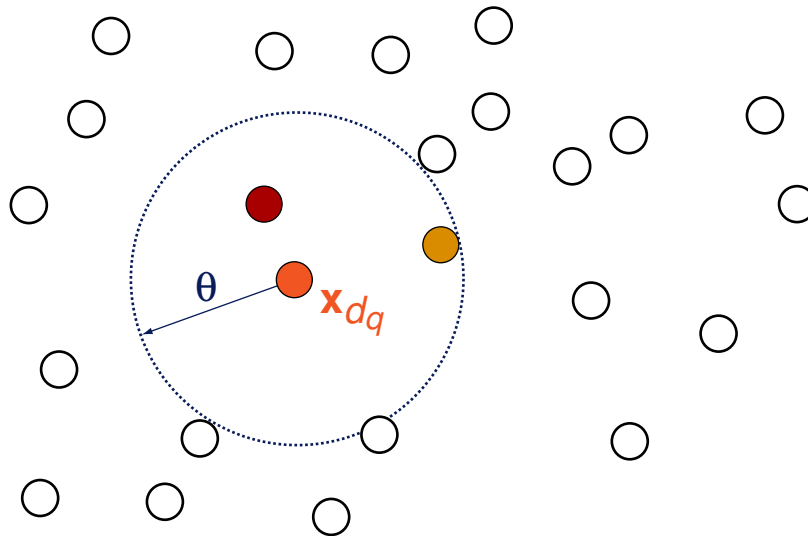

# Introduction

Given a passage of text,  
find all the books containing something similar.

# Introduction

## Nearest Neighbor Search

### Applications:

- ❑ elimination of duplicates / near duplicates
- ❑ identification of versioned and plagiarized documents
- ❑ retrieval of similar documents
- ❑ identification of source code plagiarism

# Introduction

## Nearest Neighbor Search

The nearest neighbor problem cannot be solved efficiently in high dimensions by partitioning methods.

*“Existing methods are outperformed on average by a simple sequential scan, if the number of dimensions exceeds around 10.”*

[Weber 99, Gionis/Indyk/Motwani 99-04]

# Framework

Options for retrieval speed up:

- Dimension reduction
- Fingerprinting

**Part 1 of the Framework**

**Dimension Reduction**

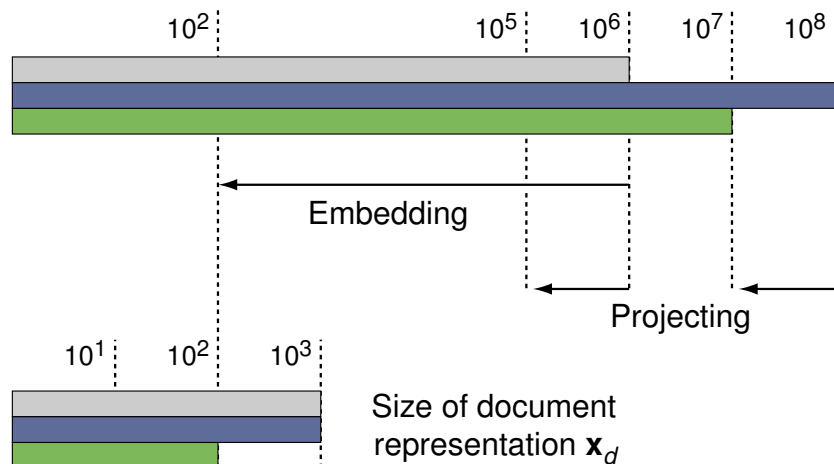

# Compact Retrieval Models

## Dimension Reduction

	Alternative 1	Alternative 2
Dimension reduction	Projecting	Embedding
Rationale	Hypothesis Test	Model Fidelity
Implementation	Shingling	Fuzzy-Fingerprinting

English Wikipedia:

Dictionary	Number of dimensions
1-gram space	3 921 588
4-gram space	274 101 016
8-gram space	373 795 734
Shingling space	75 659 644

# Compact Retrieval Models

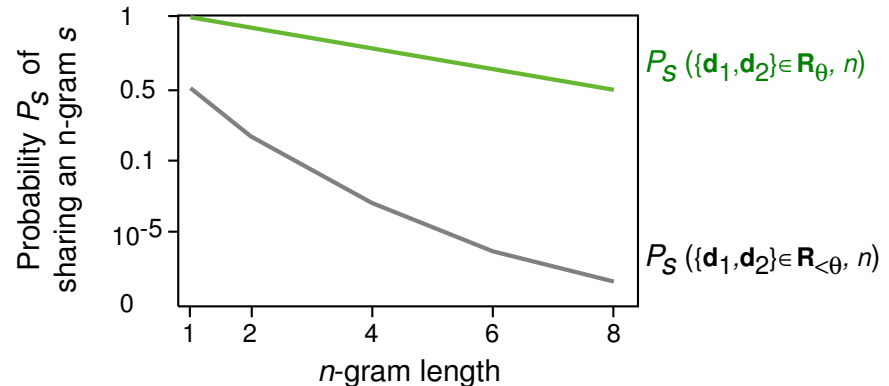

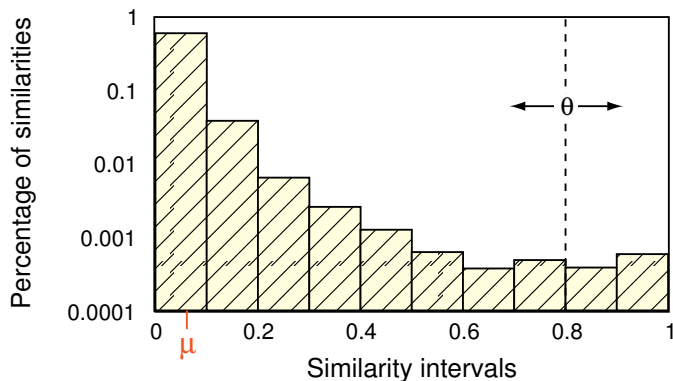

## Alternative 1: Projecting / Hypothesis Test

Consideration: If two documents share an  $n$ -gram, does this tell us something about their similarity?

$H_0$  : “ $\{d_1, d_2\}$  is from  $\mathbf{R}_{<\theta}$ ”

$H_1$  : “ $\{d_1, d_2\}$  is from  $\mathbf{R}_\theta$ ”

$$\frac{|\mathbf{R}_{<\theta}| \cdot P_s(\{d_1, d_2\} \in \mathbf{R}_{<\theta}, n=8)}{|\mathbf{R}_\theta| \cdot P_s(\{d_1, d_2\} \in \mathbf{R}_\theta, n=8)} \sim \frac{P_0}{P_1}$$

# Compact Retrieval Models

## Alternative 2: Embedding / Model Fidelity

Consideration: If the low-dimensional vector space resembles the similarity relations of the high-dimensional vector space, retrieval with the former works just as well as with the latter.

Multidimensional scaling (MDS)  $\Rightarrow$  Singular Value Decomposition (SVD)

On the downside:

- The computation of a SVD has a high runtime complexity.
- The SVD models noise.

Heuristic methods for MDS are at hand.

$\mathbf{X}$ . Objects in (high-dimensional) original space, with cos-similarity matrix  $\mathbf{S}$ .

$\mathbf{Y}$ . Objects in  $k$ -dimensional embedding space, with cos-similarity matrix  $\hat{\mathbf{S}}$ .

$\mathbf{S} = \mathbf{X}^T \mathbf{X}$ , if the  $\mathbf{x} \in \mathbf{X}$  are normalized under the  $l_2$ -norm.

SVD of  $\mathbf{X}$  yields the optimum embedding  $\mathbf{Y}_{SVD}$  :  $\hat{\mathbf{S}}^* = \mathbf{V}_k \Sigma_k^2 \mathbf{V}_k^T =: \mathbf{Y}_{SVD}^T \mathbf{Y}_{SVD}$

# Summary

- ❑ Framework for compact retrieval models.
- ❑ Dimension reduction allows for an retrieval quality comparable to that of BOW models.
- ❑ The memory footprint is orders of magnitude lower than BOW models.
- ❑ Embedding outperforms projection in the dimension reduction task.
- ❑ Fingerprinting based on hashing allows for  $O(1)$  retrieval with imperfect recall.

Thank you for your attention!
